Moscow, Russia
June 2014

Revised Supplementary Release on Backward Equations for Specific Volume as a Function of Pressure and Temperature *v*(*p*,*T*) for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam

President:
Professor Tamara Petrova
Moscow Power Engineering Institute
Moscow, Russia

Executive Secretary:
Dr. R. B. Dooley
Structural Integrity Associates
Southport, Merseyside, UK
Email: bdooley@structint.com

This supplementary release replaces the corresponding supplementary release of 2005, and contains 35 pages, including this cover page.

This revised supplementary release has been authorized by the International Association for the Properties of Water and Steam (IAPWS) at its meeting in Moscow, Russia, 22-27 June, 2014, for issue by its Secretariat. The members of IAPWS are: Britain and Ireland, Canada, the Czech Republic, Germany, Japan, Russia, Scandinavia (Denmark, Finland, Norway, Sweden), and the United States, and associate members Argentina & Brazil, Australia, France, Greece, Italy, New Zealand, and Switzerland.

The backward equations $v(p,T)$ for Region 3 provided in this release are recommended as a supplement to "The IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam" (IAPWS-IF97) [1, 2]. Further details concerning the equations of this revised supplementary release can be found in the corresponding article by H.-J. Kretzschmar *et al.* [3].

This revision consists of edits to clarify descriptions of how to determine the region or subregion; the property calculations are unchanged.

Further information concerning this supplementary release, other releases, supplementary releases, guidelines, technical guidance documents, and advisory notes issued by IAPWS can be obtained from the Executive Secretary of IAPWS or from http://www.iapws.org.

Contents

1 Nomenclature

Thermodynamic quantities:

c_p Specific isobaric heat capacity
f Specific Helmholtz free energy
h Specific enthalpy
p Pressure
s Specific entropy
T Absolute temperature [a]
v Specific volume
w Speed of sound
θ Reduced temperature $\theta = T/T^*$
π Reduced pressure, $\pi = p/p^*$
ω Reduced volume, $\omega = v/v^*$
Δ Difference in any quantity

Superscripts:

97 Quantity or equation of IAPWS-IF97
01 Equation of IAPWS-IF97-S01
03 Equation of IAPWS-IF97-S03rev
04 Equation of IAPWS-IF97-S04

* Reducing quantity
' Saturated liquid state
" Saturated vapor state

Subscripts:

1…5	Region 1…5
3a …3z	Subregion 3a…3z
3ab	Boundary between subregions 3a, 3d and 3b, 3e
3cd	Boundary between subregions 3c and 3d, 3g, 3l, 3q, 3s
3ef	Boundary between subregions 3e, 3h, 3n and 3f, 3i, 3o
3gh	Boundary between subregions 3g, 3l and 3h, 3m
3ij	Boundary between subregions 3i, 3p and 3j
3jk	Boundary between subregions 3j, 3r and 3k
3mn	Boundary between subregions 3m and 3n
3op	Boundary between subregions 3o and 3p
3qu	Boundary between of subregion 3q and 3u
3rx	Boundary between of subregion 3r and 3x
3uv	Boundary between subregions 3u and 3v
3wx	Boundary between subregions 3w and 3x
B23	Boundary between regions 2 and 3
c	Critical point
it	Iterated quantity
max	Maximum value of a quantity
RMS	Root-mean-square value of a quantity
sat	Saturation state
tol	Tolerated value of a quantity

Root-mean-square value:

$$\Delta x_{\mathrm{RMS}} = \sqrt{\frac{1}{N}\sum_{n=1}^{N}(\Delta x_n)^2}$$

where Δx_n can be either absolute or percentage difference between the corresponding quantities x; N is the number of Δx_n values (10 million points uniformly distributed over the range of validity in the p-T plane).

[a] Note: T denotes absolute temperature on the International Temperature Scale of 1990 (ITS-90).

2 Background

The IAPWS Industrial Formulation 1997 for the thermodynamic properties of water and steam (IAPWS-IF97) [1, 2] contains basic equations, saturation equations and equations for the frequently used backward functions $T(p,h)$ and $T(p,s)$ valid in the liquid region 1 and the vapor region 2; see Figure 1. IAPWS-IF97 was supplemented by "Supplementary Release on Backward Equations for Pressure as a Function of Enthalpy and Entropy $p(h,s)$ to the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam" [4, 5], which will be referred to as IAPWS-IF97-S01. These equations are valid in region 1 and region 2. An additional "Supplementary Release on Backward Equations for the Functions $T(p,h)$, $v(p,h)$ and $T(p,s)$, $v(p,s)$ for Region 3 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam" [6, 7], which will be referred to as IAPWS-IF97-S03rev, was adopted by IAPWS in 2003 and revised in 2004. In 2004, IAPWS-IF97 was supplemented by "Supplementary Release on Backward Equations $p(h,s)$ for Region 3, Equations as a Function of h and s for the Region Boundaries, and an Equation $T_{\mathrm{sat}}(h,s)$ for Region 4 of the IAPWS Industrial Formulation 1997 for the Thermodynamic Properties of Water and Steam" (referred to here as IAPWS-IF97-S04) [8, 9].

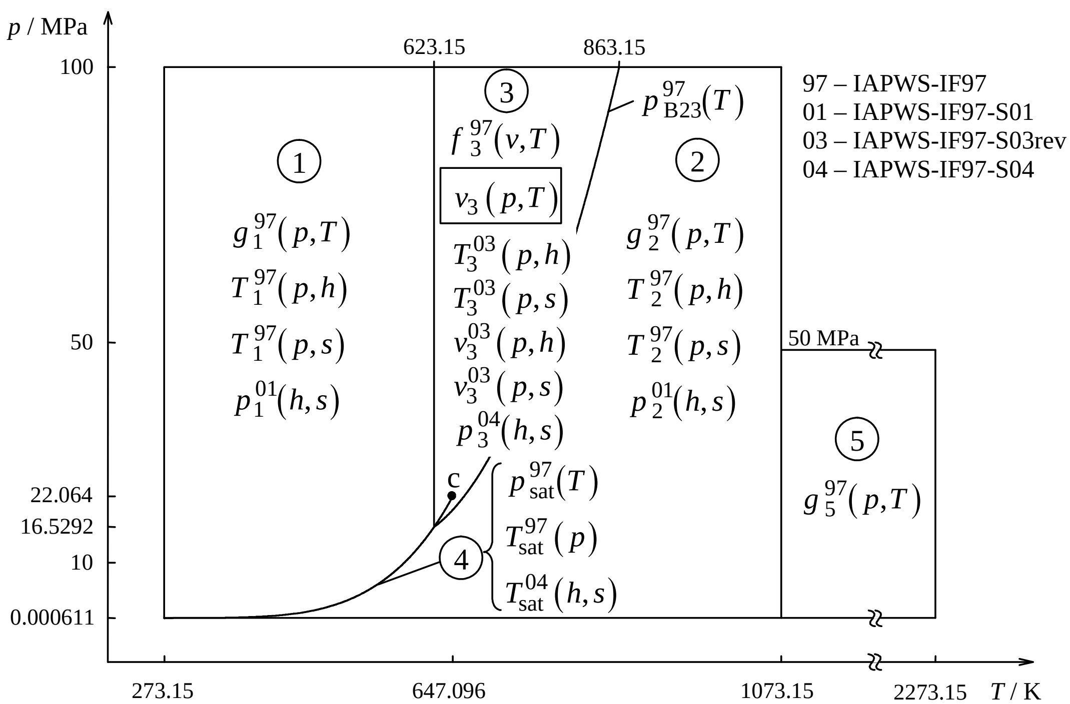

Figure 1. Regions and equations of IAPWS-IF97, IAPWS-IF97-S01, IAPWS-IF97-S03rev, IAPWS-IF97-S04, and the equations $v_3(p,T)$ of this release

IAPWS-IF97 region 3 is covered by a basic equation for the Helmholtz free energy $f(v,T)$. All thermodynamic properties can be derived from the basic equation as a function of specific volume v and temperature T. However, in modeling some steam power cycles, thermodynamic properties as functions of the variables (p,T) are required in region 3. It is cumbersome to perform these calculations with IAPWS-IF97, because they require iterations of v from p and T using the function $p(v,T)$ derived from the IAPWS-IF97 basic equation $f(v,T)$.

In order to avoid such iterations, this release provides equations $v_3(p,T)$; see Figure 1. With specific volume v calculated from the equations $v_3(p,T)$, the other properties in region 3 can be calculated using the IAPWS-IF97 basic equation $f(v,T)$.

For process calculations, the numerical consistency requirements for the equations $v(p,T)$ are very strict. Because the specific volume in the p-T plane has a complicated structure, including an infinite slope at the critical point, region 3 was divided into 26 subregions. The first 20 subregions and their associated backward equations, described in Section 5, cover almost all of region 3 and fully meet the consistency requirements. For a small area very near the critical point, it was not possible to meet the consistency requirements fully. This near-critical region is covered with reasonable consistency by six subregions with auxiliary equations, described in Section 6.

3 Numerical Consistency Requirements

The permissible value for the numerical consistency of the equations for specific volume with the IAPWS-IF97 fundamental equation was determined based on the required accuracy of the iteration otherwise used. The iteration accuracy depends on thermodynamic process calculations. To obtain specific enthalpy or entropy from pressure and temperature in region 3 with a maximum deviation of 0.001 % from IAPWS-IF97, and isobaric heat capacity or speed of sound with a maximum deviation of 0.01 %, a relative accuracy of $|\Delta v/v| = 0.001\,\%$ is sufficient. Therefore, the permissible relative tolerance for the equations $v(p,T)$ was set to $|\Delta v/v|_{\mathrm{tol}} = 0.001\,\%$.

4 Structure of the Equation Set

The range of validity of the equations $v_3(p,T)$ is region 3 defined by:

$$623.15\ \mathrm{K} < T \le 863.15\ \mathrm{K} \ \text{ and } \ p_{\mathrm{B23}}^{97}(T) < p \le 100\ \mathrm{MPa}.$$

The function $p_{\mathrm{B23}}^{97}(T)$ represents the B23-equation of IAPWS-IF97.

It proved to be infeasible to achieve the numerical consistency requirement of 0.001 % for $v_3(p,T)$ using simple functional forms in the region

$$T_{3\mathrm{qu}}(p) < T \le T_{3\mathrm{rx}}(p) \text{ for } p_{\mathrm{sat}}^{97}(643.15\ \mathrm{K}) < p \le 22.5\ \mathrm{MPa}\text{ ; see Figure 2.}$$

This limitation is due to the infinite slope of the specific volume at the critical point. In order to cover region 3 completely, Section 6 contains auxiliary equations for this small region very close to the critical point.

Figure 2 shows the range of validity of the backward and auxiliary equations.

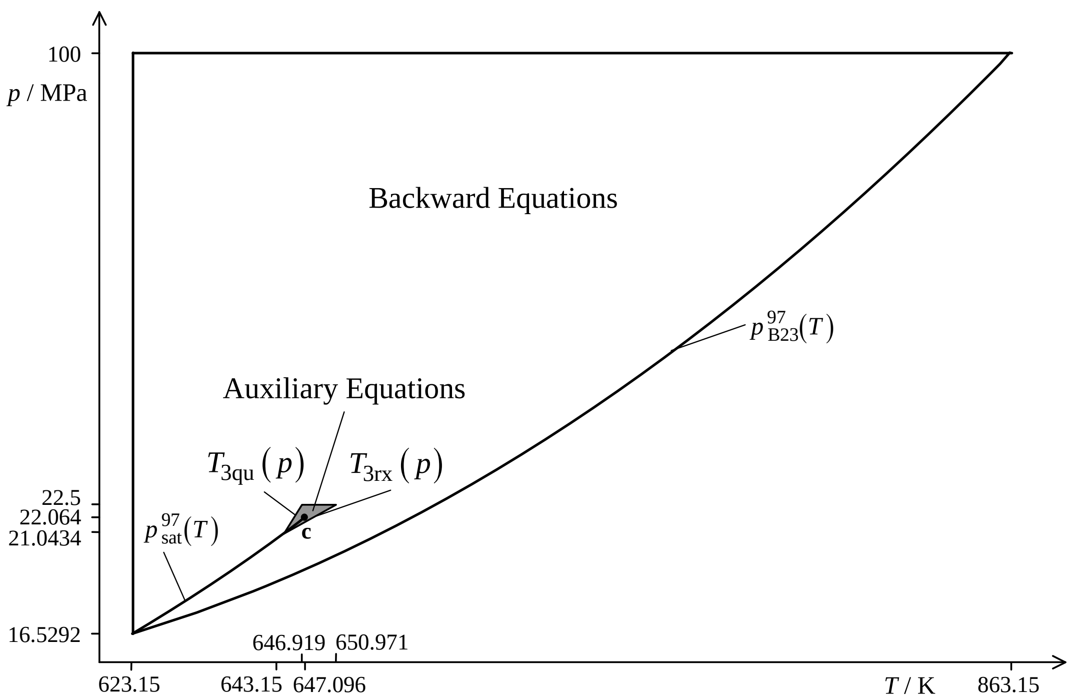

Figure 2. Range of validity of the backward and auxiliary equations. The area marked in gray is not true to scale but enlarged to make the small area better visible.

5 Backward Equations *v*(*p*,*T*) for the Subregions 3a to 3t

5.1 Subregions

Preliminary investigations showed that it was not possible to meet the numerical consistency requirement with only a few $v(p,T)$ equations. Therefore, the main part of region 3 was divided into 20 subregions 3a to 3t; see Figures 3 and 4.

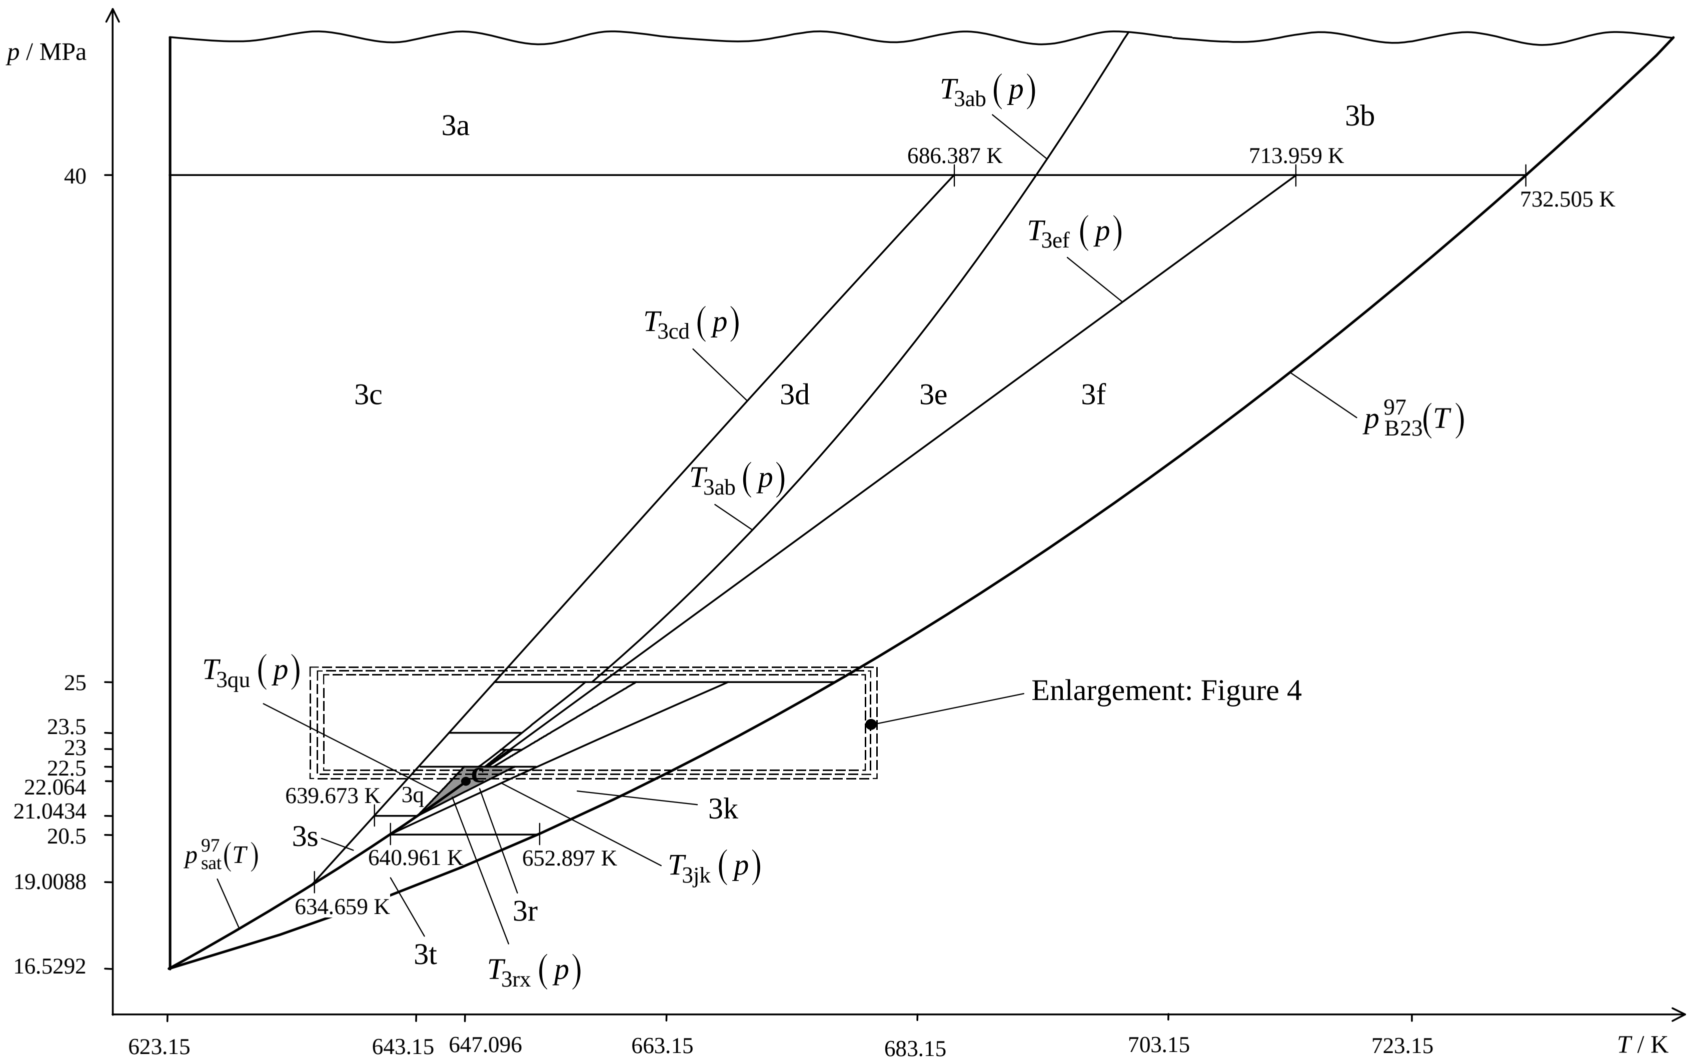

Figure 3. Division of region 3 into subregions for the backward equations $v_3(p,T)$

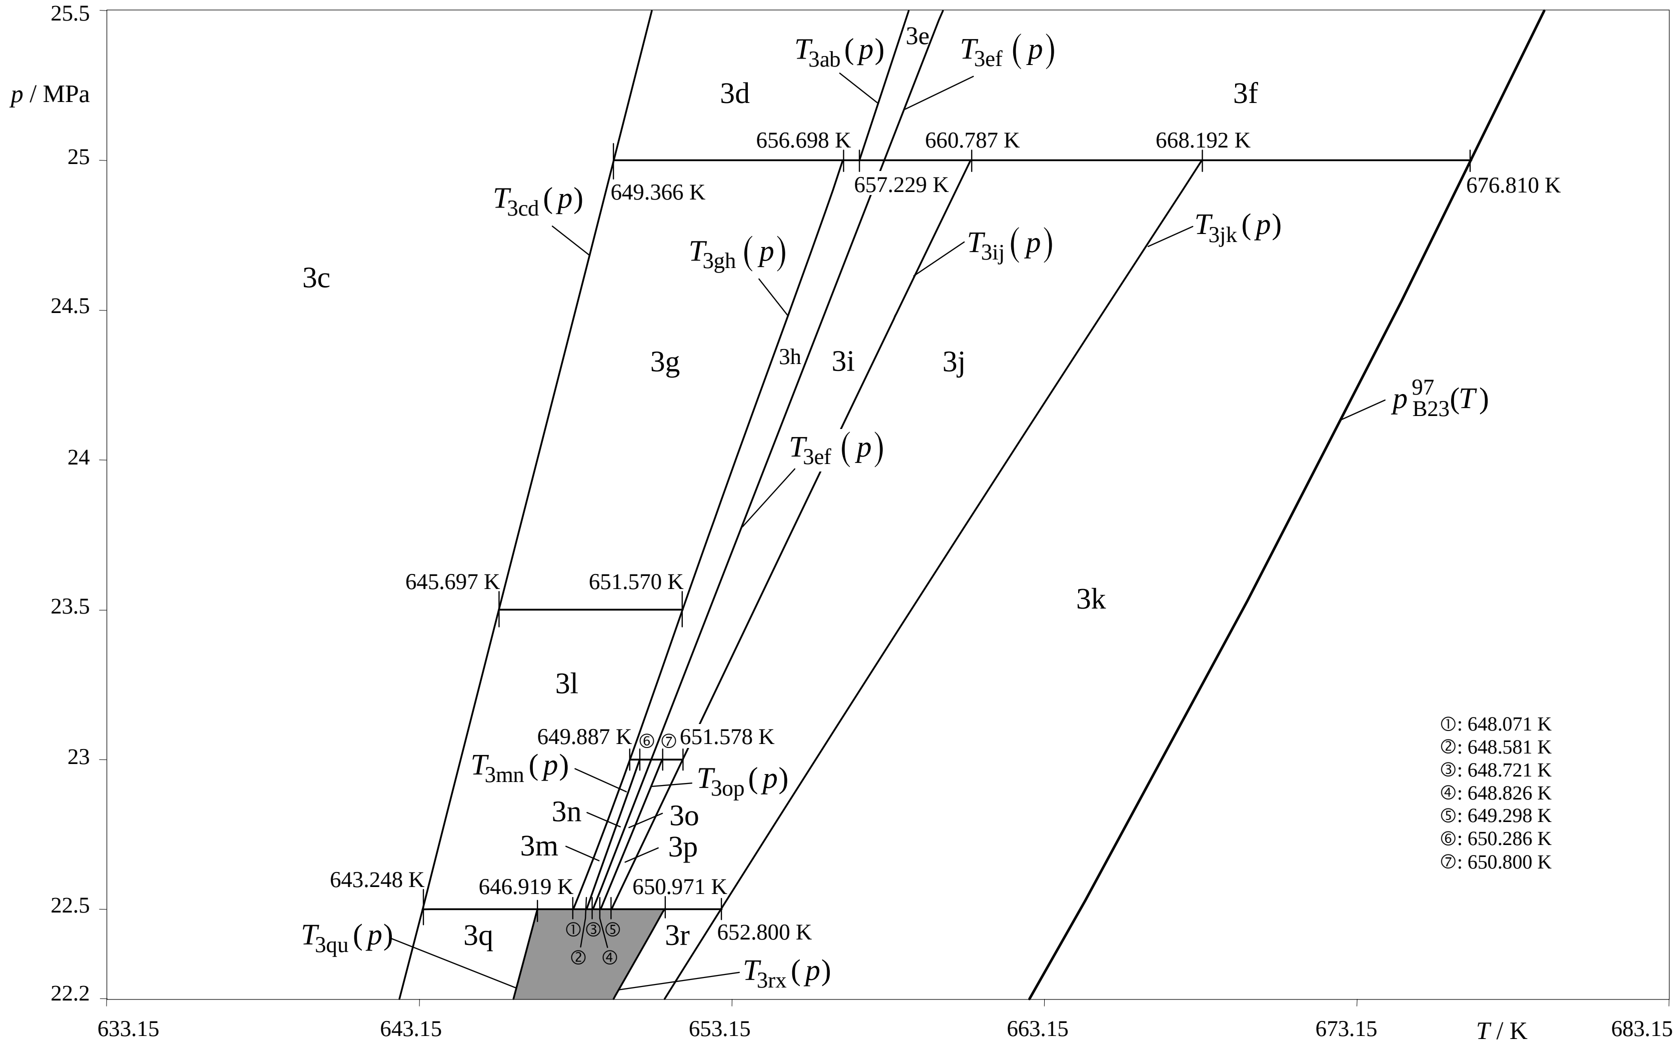

Figure 4. Enlargement from Figure 3 for the subregions 3c to 3r for the backward equation $v(p,T)$

The subregion boundary equations, except for $T_{3\text{ab}}(p)$, $T_{3\text{ef}}(p)$, and $T_{3\text{op}}(p)$, have the following dimensionless form:

$$\frac{T(p)}{T^*} = \theta(\pi) = \sum_{i=1}^{N} n_i \, \pi^{I_i} \ , \tag{1}$$

where $\theta = T/T^*$, $\pi = p/p^*$, with $T^* = 1\,\text{K}$, $p^* = 1\,\text{MPa}$.

The equations $T_{3\text{ab}}(p)$ and $T_{3\text{op}}(p)$ have the form:

$$\frac{T(p)}{T^*} = \theta(\pi) = \sum_{i=1}^{N} n_i \, (\ln \pi)^{I_i} \ , \tag{2}$$

and $T_{3\text{ef}}(p)$ has the form:

$$\frac{T_{3\text{ef}}(p)}{T^*} = \theta_{3\text{ef}}(\pi) = \left.\frac{\partial \theta_{\text{sat}}}{\partial \pi}\right|_{\text{c}} (\pi - 22.064) + 647.096 \ , \tag{3}$$

where $\partial\theta_{\text{sat}}/\partial\pi|_{\text{c}} = 3.727\,888\,004$.

The coefficients n_i and the exponents I_i of the boundary equations are listed in Table 1.

Table 1. Numerical values of the coefficients of the equations for subregion boundaries (except $T_{3\text{ef}}(p)$)

Equation	i	I_i	n_i	i	I_i	n_i
$T_{3\text{ab}}(p)$	1	0	$0.154\,793\,642\,129\,415 \times 10^{4}$	4	–1	$-0.191\,887\,498\,864\,292 \times 10^{4}$

The following description of the use of the subregion boundary equations is summarized in Table 2 and Figures 3 and 4.

Table 2. Pressure ranges and corresponding subregion boundary equations for determining the correct subregion, 3a to 3t, for the backward equations $v(p,T)$

Pressure Range	Sub-region	For	Sub-region	For
40 MPa < $p \le$ 100 MPa	3a	$T \le T_{3ab}(p)$	3b	$T > T_{3ab}(p)$
25 MPa < $p \le$ 40 MPa	3c	$T \le T_{3cd}(p)$	3e	$T_{3ab}(p) < T \le T_{3ef}(p)$
	3d	$T_{3cd}(p) < T \le T_{3ab}(p)$	3f	$T > T_{3ef}(p)$
23.5 MPa < $p \le$ 25 MPa	3c	$T \le T_{3cd}(p)$	3i	$T_{3ef}(p) < T \le T_{3ij}(p)$
	3g	$T_{3cd}(p) < T \le T_{3gh}(p)$	3j	$T_{3ij}(p) < T \le T_{3jk}(p)$
	3h	$T_{3gh}(p) < T \le T_{3ef}(p)$	3k	$T > T_{3jk}(p)$
23 MPa < $p \le$ 23.5 MPa	3c	$T \le T_{3cd}(p)$	3i	$T_{3ef}(p) < T \le T_{3ij}(p)$
	3l	$T_{3cd}(p) < T \le T_{3gh}(p)$	3j	$T_{3ij}(p) < T \le T_{3jk}(p)$
	3h	$T_{3gh}(p) < T \le T_{3ef}(p)$	3k	$T > T_{3jk}(p)$
22.5 MPa < $p \le$ 23 MPa	3c	$T \le T_{3cd}(p)$	3o	$T_{3ef}(p) < T \le T_{3op}(p)$
	3l	$T_{3cd}(p) < T \le T_{3gh}(p)$	3p	$T_{3op}(p) < T \le T_{3ij}(p)$
	3m	$T_{3gh}(p) < T \le T_{3mn}(p)$	3j	$T_{3ij}(p) < T \le T_{3jk}(p)$
	3n	$T_{3mn}(p) < T \le T_{3ef}(p)$	3k	$T > T_{3jk}(p)$
$p_{sat}^{97}(643.15\text{ K}) < p \le$ 22.5 MPa	3c	$T \le T_{3cd}(p)$	3r	$T_{3rx}(p) < T \le T_{3ik}(p)$
	3q	$T_{3cd}(p) < T \le T_{3qu}(p)$	3k	$T > T_{3jk}(p)$
20.5 MPa < $p \le p_{sat}^{97}(643.15\text{ K})$	3c	$T \le T_{3cd}(p)$	3r	$T_{sat}^{97}(p) \le T \le T_{3jk}(p)$
	3s	$T_{3cd}(p) < T \le T_{sat}^{97}(p)$	3k	$T > T_{3jk}(p)$
p_{3cd} [b] $< p \le$ 20.5 MPa	3c	$T \le T_{3cd}(p)$	3t	$T \ge T_{sat}^{97}(p)$
	3s	$T_{3cd}(p) < T \le T_{sat}^{97}(p)$		
$p_{sat}^{97}(623.15\text{ K}) < p \le p_{3cd}$ [b]	3c	$T \le T_{sat}^{97}(p)$	3t	$T \ge T_{sat}^{97}(p)$

[b] $p_{3cd} = 1.900\,881\,189\,173\,929 \times 10^1$ MPa

The equation $T_{3ab}(p)$ approximates the critical isentrope from 25 MPa to 100 MPa and represents the boundary equation between subregion 3a and subregion 3d.

The equation $T_{3cd}(p)$ ranges from $p_{3cd} = 1.900\,881\,189\,173\,929 \times 10^1$ MPa to 40 MPa. The pressure of $p_{3cd} = 1.900\,881\,189\,173\,929 \times 10^1$ MPa is given as $T_{sat}^{97}(p) - T_{3cd}(p) = 0$. The equation $T_{3cd}(p)$ represents the boundary equation between subregions 3d, 3g, 3l, 3q or 3s, and subregion 3c.

The equation $T_{3gh}(p)$ ranges from 22.5 MPa to 25 MPa and represents the boundary equation between subregions 3h or 3m and subregions 3g or 3l.

The equation $T_{3ij}(p)$ approximates the isochore $v = 0.0041\,\text{m}^3\,\text{kg}^{-1}$ from 22.5 MPa to 25 MPa and represents the boundary equation between subregion 3j and subregions 3i or 3p.

The equation $T_{3jk}(p)$ approximates the isochore $v = v''(20.5\,\text{MPa})$ from 20.5 MPa to 25 MPa and represents the boundary equation between subregion 3k and subregions 3j or 3r.

The equation $T_{3\text{mn}}(p)$ approximates the isochore $v = 0.0028\ \text{m}^3\ \text{kg}^{-1}$ from 22.5 MPa to 23 MPa and represents the boundary equation between subregion 3n and subregion 3m.

The equation $T_{3\text{op}}(p)$ approximates the isochore $v = 0.0034\ \text{m}^3\ \text{kg}^{-1}$ from 22.5 MPa to 23 MPa and represents the boundary equation between subregion 3p and subregion 3o.

The equation $T_{3\text{qu}}(p)$ approximates the isochore $v = v'(643.15\ \text{K})$ from $p = p_{\text{sat}}^{97}(643.15\ \text{K})$, where , $p_{\text{sat}}^{97}(643.15\ \text{K}) = 2.104\ 336\ 732 \times 10^1\ \text{MPa}$ to 22.5 MPa and represents the boundary equation between subregion 3q and subregion 3r (see Fig. 5).

The equation $T_{3\text{rx}}(p)$ approximates the isochore $v = v''(643.15\ \text{K})$ from $p = p_{\text{sat}}^{97}(643.15\ \text{K})$, where $p_{\text{sat}}^{97}(643.15\ \text{K}) = 2.104\ 336\ 732 \times 10^1\ \text{MPa}$, to 22.5 MPa and represents the boundary equation between subregion 3r and subregion 3x (see Fig.5).

The subregion boundary equation $T_{3\text{ef}}(p)$ is a straight line from 22.064 MPa to 40 MPa having the slope of the saturation-temperature curve of IAPWS-IF97 at the critical point. It divides subregions 3f, 3i or 3o from subregions 3e, 3h or 3n.

Computer-program verification

To assist the user in computer-program verification of the equations for the subregion boundaries, Table 3 contains test values for calculated temperatures.

Table 3. Selected temperature values calculated from the subregion boundary equations [c]

Equation	p MPa	T K	Equation	p MPa	T K
$T_{3\text{ab}}(p)$	40	$6.930\ 341\ 408 \times 10^2$	$T_{3\text{jk}}(p)$	23	$6.558\ 338\ 344 \times 10^2$
$T_{3\text{cd}}(p)$	25	$6.493\ 659\ 208 \times 10^2$	$T_{3\text{mn}}(p)$	22.8	$6.496\ 054\ 133 \times 10^2$
$T_{3\text{ef}}(p)$	40	$7.139\ 593\ 992 \times 10^2$	$T_{3\text{op}}(p)$	22.8	$6.500\ 106\ 943 \times 10^2$
$T_{3\text{gh}}(p)$	23	$6.498\ 873\ 759 \times 10^2$	$T_{3\text{qu}}(p)$	22	$6.456\ 355\ 027 \times 10^2$
$T_{3\text{ij}}(p)$	23	$6.515\ 778\ 091 \times 10^2$	$T_{3\text{rx}}(p)$	22	$6.482\ 622\ 754 \times 10^2$

[c] It is recommended that programmed functions be verified using 8 byte real values for all variables.

5.2 Backward Equations *v*(*p*,*T*) for the Subregions 3a to 3t

The backward equations $v(p,T)$ for the subregions 3a to 3t, except for 3n, have the following dimensionless form:

$$\frac{v(p,T)}{v^*} = \omega(\pi,\theta) = \left[\sum_{i=1}^{N} n_i \left[(\pi-a)^c\right]^{I_i} \left[(\theta-b)^d\right]^{J_i}\right]^e . \tag{4}$$

The equation for subregion 3n has the form:

$$\frac{v_{3\mathrm{n}}(p,T)}{v^*} = \omega_{3\mathrm{n}}(\pi,\theta) = \exp\left\{\sum_{i=1}^{N} n_i\,(\pi-a)^{I_i}\,(\theta-b)^{J_i}\right\}, \tag{5}$$

with $\omega = v/v^*$, $\pi = p/p^*$, and $\theta = T/T^*$. The reducing quantities v^*, p^*, and T^*, the number of coefficients *N*, the non-linear parameters *a* and *b*, and the exponents *c*, *d*, and *e* are listed in Table 4 for the equations of the subregions 3a to 3t. The coefficients n_i and exponents I_i and J_i of these equations are listed in Tables A1.1 to A1.20 of the Appendix.

Table 4. Reducing quantities *v**, *p**, and *T**, number of coefficients *N*, non-linear parameters *a* and *b*, and exponents *c*, *d*, and *e* for the $v(p,T)$ equations of the subregions 3a to 3t

Computer-program verification

To assist the user in computer-program verification of the equations for the subregions 3a to 3t, Table 5 contains test values for calculated specific volumes.

Table 5. Selected specific volume values calculated from the equations for the subregions 3a to 3t [d]

Equation	p MPa	T K	v $\mathrm{m^3\,kg^{-1}}$	Equation	p MPa	T K	v $\mathrm{m^3\,kg^{-1}}$
$v_{3a}(p,T)$	50	630	$1.470\,853\,100 \times 10^{-3}$	$v_{3k}(p,T)$	23	660	$6.109\,525\,997 \times 10^{-3}$
	80	670	$1.503\,831\,359 \times 10^{-3}$		24	670	$6.427\,325\,645 \times 10^{-3}$
$v_{3b}(p,T)$	50	710	$2.204\,728\,587 \times 10^{-3}$	$v_{3l}(p,T)$	22.6	646	$2.117\,860\,851 \times 10^{-3}$
	80	750	$1.973\,692\,940 \times 10^{-3}$		23	646	$2.062\,374\,674 \times 10^{-3}$

[d] It is recommended that programmed functions be verified using 8 byte real values for all variables.

5.3 Calculation of Thermodynamic Properties with the $v(p,T)$ Backward Equations

The $v(p,T)$ backward equations described in Section 5.2 together with IAPWS-IF97 basic equation $f(v,T)$ make it possible to determine all thermodynamic properties, *e.g.*, enthalpy, entropy, isobaric heat capacity, speed of sound, from pressure p and temperature T in region 3 without iteration.

The following steps should be made:

- Identify the subregion (3a to 3t) for given pressure p and temperature T following the instructions of Section 5.1 in conjunction with Table 2 and Figures 3 and 4. Then, calculate the specific volume v for the subregion using the corresponding backward equation $v(p,T)$.

- Calculate the desired thermodynamic property from the previously calculated specific volume v and the given temperature T using the derivatives of the IAPWS-IF97 basic equation $f(v,T)$, where $v = v(p,T)$; see Table 31 in [1].

5.4 Numerical Consistency

5.4.1 Numerical Consistency with the Basic Equation of IAPWS-IF97

The maximum relative deviations and root-mean-square relative deviations of specific volume, calculated from the backward equations $v(p,T)$ for subregions 3a to 3t, from the IAPWS-IF97 basic equation $f(v,T)$ in comparison with the permissible tolerances are listed in Table 6. The calculation of the root-mean-square values is described in Section 1.

Table 6 also contains the maximum relative deviations and root-mean-square relative deviations of specific enthalpy, specific entropy, specific isobaric heat capacity, and speed of sound, calculated as described in Section 5.3.

Table 6. Maximum relative deviations and root-mean-square relative deviations of the specific volume, calculated from the backward equations for subregions 3a to 3t, and maximum relative deviations of specific enthalpy, specific entropy, specific isobaric heat capacity and speed of sound, calculated as described in Section 5.3, from the IAPWS-IF97 basic equation $f(v,T)$

Subregion	$\lvert\Delta v/v\rvert$ %		$\lvert\Delta h/h\rvert$ %		$\lvert\Delta s/s\rvert$ %		$\lvert\Delta c_p/c_p\rvert$ %		$\lvert\Delta w/w\rvert$ %

3t	0.00095	0.00045	0.00022	0.00010	0.00018	0.00008	0.0046	0.0015	0.0004	0.0002
permissible tolerance	0.001		0.001		0.001		0.01		0.01	

Table 6 shows that the deviations of the specific volume, specific enthalpy, and specific entropy from the IAPWS-IF97 basic equation are less than 0.001 % and the deviations of specific isobaric heat capacity and speed of sound are less than 0.01 %. Therefore, the values of specific volume, specific enthalpy and specific entropy of IAPWS-IF97 are represented with 5 significant figures, and the values of specific isobaric heat capacity and speed of sound with 4 significant figures by using the backward equations $v(p,T)$.

5.4.2 Consistency at Boundaries Between Subregions

The maximum relative differences of specific volume between the $v(p,T)$ backward equations of adjacent subregions along the subregion boundary pressures are listed in the third column of Table 7. Table 8 contains these maximum relative differences along the subregion boundary equations.

Table 7. Maximum relative deviations of specific volume between the backward equations $v(p,T)$ of adjacent subregions and maximum relative deviations of specific enthalpy, specific entropy, specific isobaric heat capacity, and speed of sound, calculated as described in Section 5.3, along the subregion boundary pressures

permissible tolerance		0.001	0.001	0.001	0.01	0.01

For example, the maximum relative difference between the backward equation of subregion 3a and the backward equation of subregion 3b along the subregion boundary $T_{3ab}(p)$ was determined as follows:

$$\left|\frac{\Delta v}{v}\right|_{\max} = \left|\frac{v_{3a}\left(p, T_{3ab}(p)\right) - v_{3b}\left(p, T_{3ab}(p)\right)}{v_{3b}\left(p, T_{3ab}(p)\right)}\right|_{\max} .$$

In addition, Tables 7 and 8 contain the maximum relative differences of specific enthalpy, specific entropy, specific isobaric heat capacity and speed of sound, calculated as described in Section 5.3, along the subregion boundaries of the $v(p,T)$ backward equations. For example, the maximum relative difference of specific enthalpy along the subregion boundary $T_{3ab}(p)$ was determined as follows:

$$\left|\frac{\Delta h}{h}\right|_{\max} = \left|\frac{h_3^{97}(v_{3a}, T_{3ab}) - h_3^{97}(v_{3b}, T_{3ab})}{h_3^{97}(v_{3b}, T_{3ab})}\right|_{\max}$$

where $v_{3a} = v_{3a}\left(p, T_{3ab}(p)\right)$ and $v_{3b} = v_{3b}\left(p, T_{3ab}(p)\right)$.

Tables 7 and 8 show that the relative specific volume differences between the backward equations $v(p,T)$ of the adjacent subregions and the maximum relative deviations of specific enthalpy, specific entropy, specific isobaric heat capacity, and speed of sound along the subregion boundary pressures and along the subregion boundary equations are smaller than the permissible numerical tolerances of these equations with the IAPWS-IF97 basic equation.

6 Auxiliary Equations *v*(*p*,*T*) for the Region very close to the Critical Point

6.1 Subregions

The auxiliary equations $v(p,T)$ for the subregions 3u to 3z are valid from

$$T_{3\mathrm{qu}}(p) < T \le T_{3\mathrm{rx}}(p) \;\text{ for }\; p_{\mathrm{sat}}^{97}(643.15\ \mathrm{K}) < p \le 22.5\ \mathrm{MPa}\ ;\ \text{see Figure 5.}$$

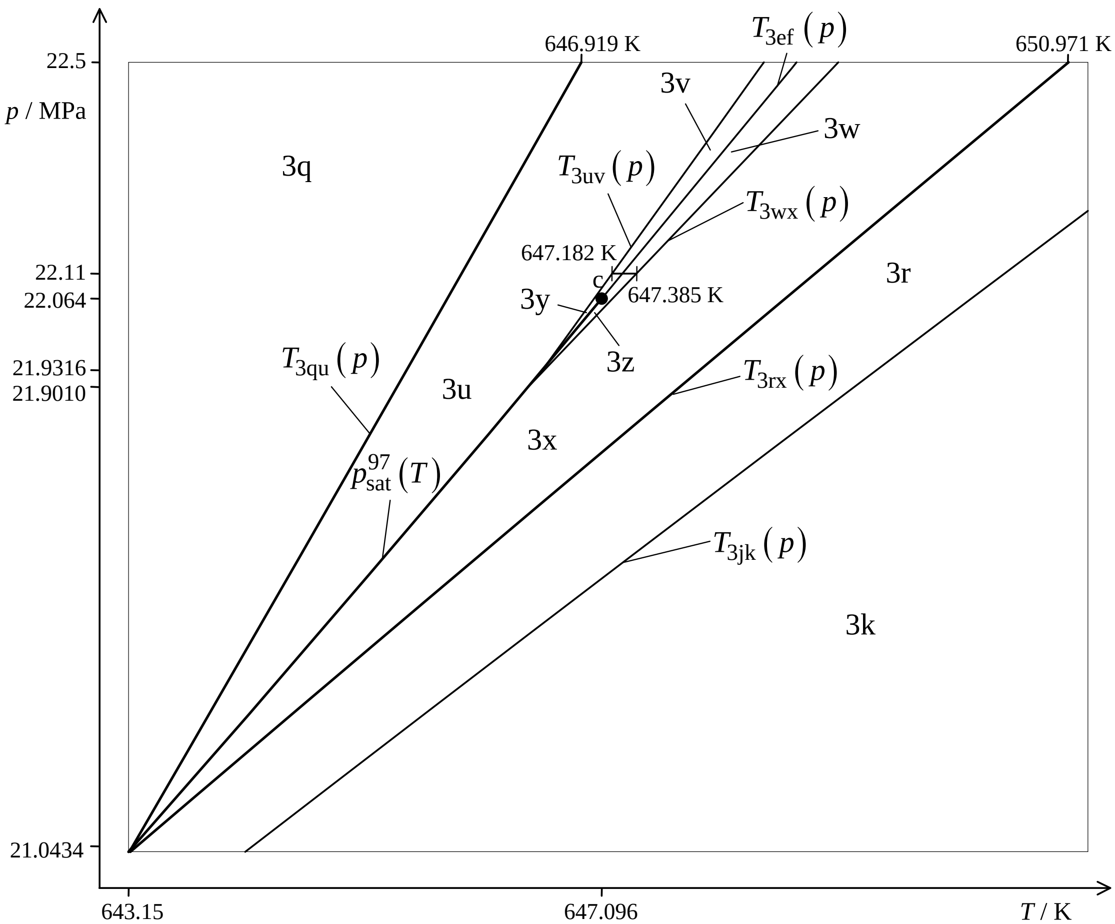

Figure 5. Division of region 3 into subregions 3u to 3z for the auxiliary equations

The subregion boundary equation $T_{3\mathrm{uv}}(p)$ has the form of Eq. (1) and $T_{3\mathrm{wx}}(p)$ has the form of Eq. (2). The coefficients n_i and the exponents I_i of the boundary equations are listed in Table 9.

Table 9. Numerical values of the coefficients of the equations $T_{3\mathrm{uv}}(p)$ and $T_{3\mathrm{wx}}(p)$ for subregion boundaries

Equation	i	I_i	n_i	i	I_i	n_i
$T_{3\mathrm{uv}}(p)$	1	0	$0.528\,199\,646\,263\,062 \times 10^3$	3	2	$-0.222\,814\,134\,903\,755$
	2	1	$0.890\,579\,602\,135\,307 \times 10^1$	4	3	$0.286\,791\,682\,263\,697 \times 10^{-2}$
$T_{3\mathrm{wx}}(p)$	1	0	$0.728\,052\,609\,145\,380 \times 10^1$	4	-1	$0.329\,196\,213\,998\,375 \times 10^3$
	2	1	$0.973\,505\,869\,861\,952 \times 10^2$	5	-2	$0.873\,371\,668\,682\,417 \times 10^3$
	3	2	$0.147\,370\,491\,183\,191 \times 10^2$			

The following description of the use of the subregion boundary equations is summarized in Table 10 and Figure 5.

Table 10. Pressure ranges and corresponding subregion boundary equations for determining the correct subregion, 3u to 3z, for the auxiliary equations $v(p,T)$

Supercritical Pressure Region				
Pressure Range	Sub-region	For	Sub-region	For

	$p_{\mathrm{sat}}^{97}(643.15\ \mathrm{K}) < p \le p_{\mathrm{sat}}^{97}\left(0.00385\ \mathrm{m^3\ kg^{-1}}\right)^{\mathrm{f}}$	3x	$T \le T_{3\mathrm{rx}}(p)$

[e] $p_{\mathrm{sat}}^{97}\left(0.00264\ \mathrm{m^3\ kg^{-1}}\right) = 2.193\,161\,551 \times 10^1\ \mathrm{MPa}$

[f] $p_{\mathrm{sat}}^{97}\left(0.00385\ \mathrm{m^3\ kg^{-1}}\right) = 2.190\,096\,265 \times 10^1\ \mathrm{MPa}$

The equation $T_{3uv}(p)$ approximates the isochore $v = 0.00264\ \mathrm{m^3\ kg^{-1}}$ from $p = p_{\mathrm{sat}}^{97}\left(0.00264\ \mathrm{m^3\ kg^{-1}}\right)$, where $p_{\mathrm{sat}}^{97}\left(0.00264\ \mathrm{m^3\ kg^{-1}}\right) = 2.193\ 161\ 551 \times 10^1\ \mathrm{MPa}$, to 22.5 MPa and represents the boundary equation between subregions 3v or 3y and subregion 3u.

The equation $T_{3wx}(p)$ approximates the isochore $v = 0.00385\ \mathrm{m^3\ kg^{-1}}$ from $p = p_{\mathrm{sat}}^{97}\left(0.00385\ \mathrm{m^3\ kg^{-1}}\right)$, where $p_{\mathrm{sat}}^{97}\left(0.00385\ \mathrm{m^3\ kg^{-1}}\right) = 2.190\ 096\ 265 \times 10^1\ \mathrm{MPa}$, to 22.5 MPa and represents the boundary equation between subregion 3x and subregions 3w or 3z.

Computer-program verification

To assist the user in computer-program verification of the equations for the subregion boundaries, Table 11 contains test values for calculated temperatures.

Table 11. Selected temperature values calculated from the subregion boundary equations $T_{3uv}(p)$ and $T_{3wx}(p)$ [g]

Equation	p MPa	T K
$T_{3uv}(p)$	22.3	$6.477\ 996\ 121 \times 10^2$
$T_{3wx}(p)$	22.3	$6.482\ 049\ 480 \times 10^2$

[g] It is recommended that programmed functions be verified using 8 byte real values for all variables.

6.2 Auxiliary Equations *v*(*p*,*T*) for the Subregions 3u to 3z

The auxiliary equations $v(p,T)$ for the subregions 3u to 3z have the dimensionless form of Eq. (4). The reducing quantities v^*, p^*, and T^*, the number of coefficients N, the non-linear parameters a and b, and the exponents c, d, and e are listed in Table 12 for the auxiliary equations of the subregions 3u to 3z. The coefficients n_i and exponents I_i and J_i are listed in Tables A2.1 to A2.6 of the Appendix.

Table 12. Reducing quantities v^*, p^*, and T^*, number of coefficients N, non-linear parameters a and b, and exponents c, d, and e for the auxiliary equations $v(p,T)$ of the subregions 3u to 3z

	22.3	648.1	$3.622\,226\,305 \times 10^{-3}$		22.064	647.15	$3.701\,940\,010 \times 10^{-3}$

[h] It is recommended that programmed functions be verified using 8 byte real values for all variables.

6.3 Numerical Consistency

6.3.1 Numerical Consistency with the Basic Equation of IAPWS-IF97

The maximum relative differences and root-mean-square relative deviations of specific volume, calculated from the auxiliary equations $v(p,T)$ for subregions 3u to 3z, to the IAPWS-IF97 basic equation $f_3^{97}(v,T)$ are listed in Table 14. For the calculation of the root-mean-square values, which is described in Section 1, one million points uniformly distributed over the range of validity in the p-T plane have been used.

Table 14 shows that the deviations of the specific volume from the IAPWS-IF97 basic equation are better than 0.1 %. Only in a small region for pressures less than 22.11 MPa (see Figure 5) do the deviations of the specific volume from the IAPWS-IF97 basic equation approach 2 %.

Table 14. Maximum relative deviations and root-mean-square relative deviations of the specific volume, calculated from the auxiliary equations for subregions 3u to 3z from the IAPWS-IF97 basic equation

Subregion	$\lvert\Delta v/v\rvert$ % max	$\lvert\Delta v/v\rvert$ % RMS	Subregion	$\lvert\Delta v/v\rvert$ % max	$\lvert\Delta v/v\rvert$ % RMS
3u	0.097	0.058	3x	0.090	0.050
3v	0.082	0.040	3y	1.77	1.04
3w	0.065	0.023	3z	1.80	0.921

6.3.2 Consistency at Boundaries Between Subregions

The maximum relative differences of specific volume between the $v(p,T)$ auxiliary equations of adjacent subregions along the subregion boundary pressures are listed in Table 15. Table 16 contains these maximum relative differences along the subregion boundary equations.

Table 15. Maximum relative deviations of specific volume between the auxiliary equations $v(p,T)$ of the adjacent subregions along the subregion boundary pressures

Subregion Boundary	Between Subregions	$\lvert\Delta v/v\rvert_{\max}$ %
$p = 22.5$ MPa	3l, 3u	0.096
	3m, 3u	0.096
	3m, 3v	0.035
	3n, 3v	0.046
	3o, 3w	0.019
	3p, 3w	0.021
	3p, 3x	0.042
	3j, 3x	0.043
$p = 22.11$ MPa	3v, 3y	1.7
	3w, 3z	1.7

Table 16. Maximum relative deviations of specific volume between the auxiliary equations $v(p,T)$ of the adjacent subregions along the subregion boundary equations

Subregion Boundary Equation	Between Subregions	$\lvert\Delta v/v\rvert_{\max}$ %
$T_{3\mathrm{qu}}(p)$	3q, 3u	0.097
$T_{3\mathrm{rx}}(p)$	3x, 3r	0.045
$T_{3\mathrm{uv}}(p)$	3u, 3v	0.14
	3u, 3y	1.8
$T_{3\mathrm{ef}}(p)$	3v, 3w	0.080
	3y, 3z	3.5
$T_{3\mathrm{wx}}(p)$	3w, 3x	0.049
	3z, 3x	1.8

7 Computing Time in Relation to IAPWS-IF97

A very important motivation for the development of the backward equations $v(p,T)$ was reducing the computing time to obtain thermodynamic properties and differential quotients from given variables (p,T) in region 3. Using IAPWS-IF97, time-consuming iteration is required. Using the $v(p,T)$ backward equations, iteration can be avoided. The calculation speed is about 17 times faster than iteration with IAPWS-IF97.

If iteration is used, the time to reach convergence can be significantly reduced by using the backward equations $v(p,T)$ to calculate very accurate starting values.

8 Application of the Backward and Auxiliary Equations *v*(*p*,*T*)

The numerical consistency of the specific volume *v* calculated from the main backward equations $v_3(p,T)$ described in Section 5 with the IAPWS-IF97 basic equation $f_3^{97}(v,T)$ is sufficient for most applications in process modeling. For many calculations, the numerical consistency of the auxiliary equations described in Section 6 is also satisfactory in the region very close to the critical point.

For applications where the demands on numerical consistency are extremely high, iteration using the IAPWS-IF97 basic equation $f(v,T)$ may be necessary. In these cases, the backward and auxiliary equations $v(p,T)$ can be used for calculating very accurate starting values.

The backward and auxiliary equations $v(p,T)$ should only be used in their ranges of validity described in Section 4. They should not be used for determining any thermodynamic derivatives. They should also not be used together with the fundamental equation in iterative calculations of other backward functions such as $T(p,h)$ or $T(p,s)$. Iteration of backward functions can only be performed by using the fundamental equations.

In any case, depending on the application, a conscious decision is required whether to use the backward and auxiliary equations $v(p,T)$ or to calculate the corresponding values by iteration from the basic equation of IAPWS-IF97.
